

# CommandX

## CommandX | Resources

A large deployment of force in confusing emergency response situations poses a challenge for every operation leader. Especially in the case of inter-organization operations, it's all too easy to lose your view of the whole. Which units are at the site, which on the way, which are still in the staging area? Command management is the basis of force and resources administration and supports the user with a structured illustration of all tactical units with the associated status. Shortages of force are detected immediately and calls for additional forces can be initiated.

- ~~X~~ Clear presentation of forces
- ~~X~~ Personnel planning
- ~~X~~ Monitoring of operational times
- ~~X~~ Additional information on units
- ~~X~~ Grouping of units
- ~~X~~ Time saving (preliminary planning)

**EUROCOMMAND®**

### Clear presentation of all forces

For dispatching approaching vehicles, CommandX offers a clear image of forces with a filter function. For example, units can be sorted by different organizations, by status report or by dispatch status.

### Time saving through optimal preliminary planning

In the majority of cases, the same forces will be involved in the operational activities based on the individual alarm and response regulations. With good preliminary planning, these forces are already being developed. In case of an emergency response operation, you can quickly make use of a suggestion list. Unknown forces can of course also be created and planned ad hoc.

### Monitoring of operational times (regeneration)

The operation leader has a duty of care for their operational forces. That's why the operation times can be predefined and monitored in the force manager. Various symbols and messages indicate compliance with recovery and rest periods.

### Grouping of units

Units can also be assigned to the operational sections in groups. In this way, you can quickly and easily group different vehicles into trains or associations for service.

### Personnel planning

It is important to have an overview of the personnel deployed, especially during large and long-term operations. Calls for additional forces or food provisions must be planned. This is where CommandX's force overview can help. It gives quick and transparent insight into the strengths of the individual units and organizations within the operation sections. At the push of a button, the export function provides the data, which can be sent via the integrated email interface or printed out.

### Additional information on units

Special vehicle fixtures, special equipment or the number of people wearing breathing apparatuses – in the case of unit management, the vehicles can be loaded with additional performance features. This helps in the assessment of capacity and in assigning forces to the operation sections.

### Keeping track

Efficiently guided resource management only works if you have an accurate overview. "Unit management" therefore divides the forces into "Alerted", "In preparation" and "In use". The status of an individual vehicle or of a grouped train is clearly shown. The vehicle status can be transferred automatically to the module by means of the interfaces to the common control center systems and the connection to the digital radio network. This leaves time to concentrate on the essential dispatching.
